## Linux HA中文指南

[https://www.novell.com/zh-cn/documentation/sle\\_ha/book\\_sleha/data/book\\_sleha.html](https://www.novell.com/zh-cn/documentation/sle_ha/book_sleha/data/book_sleha.html)

```
1 # 创建一个VIP
2 crm configure primitive VirtualIP ocf:heartbeat:IPaddr2 param ip=172.24.10.249 cidr_netmask=32 nic=eth0 op monitor interval=30
3 # 实现CMS的主备(使用ocf的原因是: lsb服务的service status命令老是没有正确的返回值)
4 crm configure primitive cloudera-scm-server ocf:cm:rjbgsrserver op monitor interval=20s timeout=60s on-fail=restart op start tim
5 # vip位置和cms master的位置绑定
6 crm configure colocation cms-with-vip inf: VirtualIP cloudera-scm-server
```

## 使用crm resource mv 会造成的影响

```
1 crm_resource -M -r VirtualIP -H master #移动到master, 并且设定偏好, 分数设定为正无穷
2 crm_resource -B -r VirtualIP          #从当前移除, 并且当前节点分数设定为负无穷
3 crm_resource -U -r VirtualIP          #清除Location设定
```

## Resource Meta-Attributes和Resource Instance Attributes

前者是关于切换的pacemaker属性配置, 后者是ocf文件中定义的配置

参考: [http://clusterlabs.org/pacemaker/doc/en-US/Pacemaker/1.1/html/Pacemaker\\_Explained/s-resource-options.html](http://clusterlabs.org/pacemaker/doc/en-US/Pacemaker/1.1/html/Pacemaker_Explained/s-resource-options.html)

修改配置: 如crm\_resource --meta --resource cloudera-scm-server --set-parameter failure-timeout --parameter-value 20s (好像是立即生效的)

设定默认配置:

crm\_attribute --type rsc\_defaults --name is-managed --update false

Field	Default	Description
<code>priority</code>	0	If not all resources can be active, the cluster stop lower priority resources in order to keep priority ones active.
<code>target-role</code>	Started	<p>What state should the cluster attempt to keep resource in? Allowed values:</p> <ul style="list-style-type: none"> <li>◦ <code>Stopped</code>: Force the resource to be stopped</li> <li>◦ <code>Started</code>: Allow the resource to be started in the case of multi-state resources, promote master if appropriate)</li> <li>◦ <code>Slave</code>: Allow the resource to be started only in Slave mode if the resource is multi-state</li> <li>◦ <code>Master</code>: Equivalent to <code>Started</code></li> </ul>
<code>is-managed</code>	TRUE	Is the cluster allowed to start and stop the resource? Allowed values: <code>true</code> , <code>false</code>
<code>resource-stickiness</code>	默认值为: <code>crm configure rsc_defaults resource-stickiness=100</code>	resource在前节点的粘性? ?
<code>requires</code>	<code>quorum</code> for resources with a <code>class</code> of <code>stonith</code> , otherwise <code>unfencing</code> if <code>unfencing</code> is active in the cluster, otherwise <code>fencing</code> if <code>stonith-enabled</code> is true, otherwise <code>quorum</code>	<p>Conditions under which the resource can be started (<i>since 1.1.8</i>) Allowed values:</p> <ul style="list-style-type: none"> <li>◦ <code>nothing</code>: can always be started</li> <li>◦ <code>quorum</code>: The cluster can only start this resource if a majority of the configured nodes are active</li> <li>◦ <code>fencing</code>: The cluster can only start this resource if a majority of the configured nodes are active <i>and</i> any failed or unknown nodes have been fenced</li> <li>◦ <code>unfencing</code>: The cluster can only start this resource if a majority of the configured nodes are active <i>and</i> any failed or unknown nodes have been fenced <i>and</i> on nodes that have been unfenced (<i>since 1.1.9</i>)</li> </ul>
<code>migration-threshold</code>	<p>INFINITY</p> <p>默认配置时，无论<code>server_monitor</code>在节点失败多少次，都不会到其他节点启动？</p> <p>似乎启动失败不受这个参数影响??? 除非<code>start-failure-is-fatal</code>是<code>false</code>，这个参数默认是<code>True</code>（意思是只要<code>start</code>的失败了，这个节点就被认为不合格了）。</p>	<p>How many failures may occur for this resource node, before this node is marked ineligible for this resource. A value of 0 indicates that this is disabled (the node will never be marked ineligible); by contrast, the cluster treats 1 (the default) as a very large but finite number. <b>option has an effect only if the failed operation-on-fail=restart (the default), and additional failed start operations, if the cluster proper failure-is-fatal is false.</b></p>

<code>failure-timeout</code>	0	How many seconds to wait before acting as failure had not occurred, and potentially all resource back to the node on which it failed of 0 indicates that this feature is disabled. If any time-based actions, this is not guaranteed to be checked more frequently than the value of <code>recheck-interval</code> (see <a href="#">Section 3.2, “Cluster Options”</a> ).
	失败的失效时间！默认失败永远不会失效。 cluster-recheck-interval配置是轮询资源限制的时间间隔（默认15分钟），failure超期需要cluster-recheck-interval一次，因此failure-timeout最好设定的比这个参数长	
<code>multiple-active</code>	stop_start	What should the cluster do if it ever finds the resource active on more than one node? Allowed values:
	需要配置两个监控角色~~~OK	<ul style="list-style-type: none"> <li>◦ <code>block</code>: mark the resource as unmanageable</li> <li>◦ <code>stop_only</code>: stop all active instances and remove them that way</li> <li>◦ <code>stop_start</code>: stop all active instances and start the resource in one location only</li> </ul>
<code>allow-migrate</code>	TRUE for ocf:pacemaker:remote resources, FALSE otherwise	Whether the cluster should try to “live migrate” a resource when it needs to be moved (see <a href="#">Section 9.4.3, “Migrating Resources”</a> )
<code>container-attribute-target</code>		Specific to bundle resources; see <a href="#">Section 10 “Bundle Node Attributes”</a>
<code>remote-node</code>		The name of the Pacemaker Remote guest resource is associated with, if any. If specified, both enables the resource as a guest node and defines the unique name used to identify the node. The guest must be configured to run the Pacemaker Remote daemon when it is started. <b>WARNING:</b> This value cannot overlap any resource or node IDs. (since 1.1.9)
<code>remote-port</code>	3121	If <code>remote-node</code> is specified, the port on the host used for its Pacemaker Remote connection. The Pacemaker Remote daemon on the guest must be configured to listen on this port. (since 1.1.9)
<code>remote-addr</code>	value of <code>remote-node</code>	If <code>remote-node</code> is specified, the IP address or hostname used to connect to the guest via Pacemaker Remote. The Pacemaker Remote daemon on the guest must be configured to accept connections on this address. (since 1.1.9)
<code>remote-connect-timeout</code>	60s	If <code>remote-node</code> is specified, how long before a pending guest connection will time out. (since 1.1.9)

## Resource Operations

指的是在OCF文件中定义的action，除了monitor、start、stop、meta-data这三个我们还以定义其他的action！在部署资源文件时，通过op可以让pacemaker定时调用action。

action可以有已下参数：

配置全局默认参数

```
crm_attribute --type op_defaults --name timeout --update 20s
```

Field	Default	Description
id		A unique name for the operation.
name		The action to perform. This can be any action supported by the agent; common values include <code>monitor</code> , <code>start</code> , and <code>stop</code> .
interval	0	How frequently (in seconds) to perform the operation. 0 means never. A positive value defines a <i>recurring</i> operation. This is typically used with <code>monitor</code> .
timeout		How long to wait before declaring the action has failed.
on-fail	restart (except for stop operations, which default to fence when STONITH is enabled and block otherwise)	The action to take if this action ever fails. Allowed values: <ul style="list-style-type: none"> <li><code>ignore</code>: Pretend the resource did not fail.</li> <li><code>block</code>: Don't perform any further operations on the resource.</li> <li><code>stop</code>: Stop the resource and do not start it elsewhere.</li> <li><code>restart</code>: Stop the resource and start it again (possibly on a different node).</li> <li><code>fence</code>: STONITH the node on which the resource failed.</li> <li><code>standby</code>: Move <i>all</i> resources away from the node on which the resource failed.</li> </ul>
enabled	TRUE	If <code>false</code> , ignore this operation definition. This is typically used to pause a particular recurring monitor operation; for example, to complement the respective resource being unmanaged ( <code>managed=false</code> ), as this alone will <u>not block any continuous monitoring</u> . Disabling the operation does not suppress the resource. Allowed values: <code>true</code> , <code>false</code> .
record-pending	FALSE	If <code>true</code> , the intention to perform the operation is recorded so that GUIs and CLI tools can indicate that an operation is in progress. This is best set as an <i>operation default</i> (see <a href="#">section 1.1.10</a> ). Allowed values: <code>true</code> , <code>false</code> .
role		Run the operation only on node(s) that the cluster has in the specified role. This only makes sense for resource monitor operations. Allowed (case-sensitive) values: <code>Stopped</code> , <code>Started</code> , and in the case of multi-state resources, <code>Slave</code> and <code>Master</code> .

**Cluster Options**

Option	Default	Description
<code>dc-version</code>		Version of Pacemaker on the cluster's DC. Determined automatically by the cluster. Often includes the hash which identifies the exact Git change built from. Used for diagnostic purposes.
<code>cluster-infrastructure</code>		The messaging stack on which Pacemaker is currently running. Determined automatically by the cluster. Used for informational and diagnostic purposes.
<code>expected-quorum-votes</code>		The number of nodes expected to be in the cluster. Determined automatically by the cluster. Used to calculate quorum in clusters that use Corosync 1 or CMAN as the messaging layer.
<code>no-quorum-policy</code>	stop	What to do when the cluster does not have quorum. Allowed values: <ul style="list-style-type: none"> <li><code>ignore:</code> continue all resource management</li> <li><code>freeze:</code> continue resource management, but don't recover resources on nodes not in the affected partition</li> <li><code>stop:</code> stop all resources in the affected cluster partition</li> <li><code>suicide:</code> fence all nodes in the affected cluster partition</li> </ul>
<code>batch-limit</code>	0 (30 before version 1.1.11)	The maximum number of actions that the cluster may execute in parallel on all nodes. The "correct" value will depend on the speed and load of your system and cluster nodes. If zero, the cluster will impose a dynamically calculated limit only when any node has high load.
<code>migration-limit</code>	-1	The number of migration jobs that the TE is allowed to execute in parallel on a node. A value of -1 means unlimited.
<code>symmetric-cluster</code>	TRUE	Can all resources run on any node by default?
<code>stop-all-resources</code>	FALSE	Should the cluster stop all resources?
<code>stop-orphan-resources</code>	TRUE	Should deleted resources be stopped? This value takes precedence over <code>managed</code> (i.e. even unmanaged resources will be stopped if deleted from configuration when this value is TRUE).
<code>stop-orphan-actions</code>	TRUE	Should deleted actions be cancelled?
<code>start-failure-is-fatal</code>	TRUE	Should a failure to start a resource on a particular node prevent further attempts on that node? If FALSE, the cluster will decide whether the resource is still eligible based on the resource's current failure count and <code>migrate-threshold</code> (see Section 9.3, "Handling Resource Failure").
<code>enable-startup-probes</code>	TRUE	Should the cluster check for active resources during startup?
<code>maintenance-mode</code>	FALSE	Should the cluster refrain from monitoring, starting and stopping resources?
<code>stonith-enabled</code>	TRUE	Should failed nodes and nodes with resources that can't be stopped be fenced? To use this value your data, set up a STONITH device and enable this.

		If true, or unset, the cluster will refuse to start resources unless one STONITH resources have been configured. If false, unresponsive node immediately assumed to be running no resources, and resource taken nodes starts without any further protection (which means <i>data loss</i> if unresponsive node still accesses shared storage, for example). See also the <code>requires</code> meta-attribute in <a href="#">Section 5.4, “Resource Options”</a> .
<code>stonith-action</code>	reboot	Action to send to STONITH device. Allowed values are <code>reboot</code> and <code>poweroff</code> . The value <code>poweroff</code> is also allowed, but is only used for legacy devices.
<code>stonith-timeout</code>	60s	How long to wait for STONITH actions (reboot, on, off) to complete
<code>stonith-max-attempts</code>	10	How many times fencing can fail for a target before the cluster will immediately re-attempt it. ( <i>since 1.1.17</i> )
<code>concurrent-fencing</code>	FALSE	Is the cluster allowed to initiate multiple fence actions concurrently? ( <i>since 1.1.15</i> )
<code>cluster-delay</code>	60s	Estimated maximum round-trip delay over the network (excluding action execution). If the TE requires an action to be executed on another node consider the action failed if it does not get a response from the other node in time (after considering the action’s own timeout). The "correct" value depends on the speed and load of your network and cluster nodes.
<code>dc-deadtime</code>	20s	How long to wait for a response from other nodes during startup. The "correct" value will depend on the speed/load of your network and of switches used.
<code>cluster-recheck-interval</code>	15min	<p>Polling interval for time-based changes to options, resource parameters and constraints.</p> <p>The Cluster is primarily event-driven, but your configuration can have changes that take effect based on the time of day. To ensure these changes take effect we can optionally poll the cluster’s status for changes. A value of 0 disables polling. Positive values are an interval (in seconds unless other SI unit is specified, e.g. 5min).</p>
<code>cluster-ipc-limit</code>	500	The maximum IPC message backlog before one cluster daemon will disconnect from another. This is of use in large clusters, for which a good value is the number of resources in the cluster multiplied by the number of nodes. The default is also the minimum. Raise this if you see "Evicting client" messages for cluster daemon PIDs in the logs.
<code>pe-error-series-max</code>	-1	The number of PE inputs resulting in ERRORS to save. Used when reporting problems. A value of -1 means unlimited (report all).
<code>pe-warn-series-max</code>	-1	The number of PE inputs resulting in WARNINGS to save. Used when reporting problems. A value of -1 means unlimited (report all).
<code>pe-input-series-max</code>	-1	The number of "normal" PE inputs to save. Used when reporting problems. A value of -1 means unlimited (report all).

<code>placement-strategy</code>	default	How the cluster should allocate resources to nodes (see <a href="#">Chapter 12, Clusters and Placement Strategy</a> ). Allowed values are <code>default</code> , <code>utilization</code> , <code>balanced</code> , and <code>minimal</code> . (since 1.1.0)
<code>node-health-strategy</code>	none	How the cluster should react to node health attributes (see <a href="#">Section 5.4.2, Node Health</a> ). Allowed values are <code>none</code> , <code>migrate-on-red</code> , <code>only-green</code> , <code>progressive</code> , and <code>custom</code> .
<code>node-health-base</code>	0	The base health score assigned to a node. Only used when <code>node-health-strategy</code> is <code>progressive</code> . (since 1.1.16)
<code>node-health-green</code>	0	The score to use for a node health attribute whose value is <code>green</code> . (when <code>node-health-strategy</code> is <code>progressive</code> or <code>custom</code> .
<code>node-health-yellow</code>	0	The score to use for a node health attribute whose value is <code>yellow</code> . (when <code>node-health-strategy</code> is <code>progressive</code> or <code>custom</code> .
<code>node-health-red</code>	0	The score to use for a node health attribute whose value is <code>red</code> . (when <code>node-health-strategy</code> is <code>progressive</code> or <code>custom</code> .
<code>remove-after-stop</code>	FALSE	<i>Advanced Use Only:</i> Should the cluster remove resources from the LFs are stopped? Values other than the default are, at best, poorly tested and potentially dangerous.
<code>startup-fencing</code>	TRUE	<i>Advanced Use Only:</i> Should the cluster shoot unseen nodes? Not using fencing is very unsafe!
<code>election-timeout</code>	2min	<i>Advanced Use Only:</i> If you need to adjust this value, it probably indicates the presence of a bug.
<code>shutdown-escalation</code>	20min	<i>Advanced Use Only:</i> If you need to adjust this value, it probably indicates the presence of a bug.
<code>crmd-integration-timeout</code>	3min	<i>Advanced Use Only:</i> If you need to adjust this value, it probably indicates the presence of a bug.
<code>crmd-finalization-timeout</code>	30min	<i>Advanced Use Only:</i> If you need to adjust this value, it probably indicates the presence of a bug.
<code>crmd-transition-delay</code>	0s	<i>Advanced Use Only:</i> Delay cluster recovery for the configured interval after additional/related events to occur. Useful if your configuration is sensitive to the order in which ping updates arrive. Enabling this option will slow down recovery under all conditions.
<code>default-resource-stickiness</code>	0	<i>Deprecated:</i> See <a href="#">Section 5.4.2, “Setting Global Defaults for Resource Attributes”</a> instead
<code>is-managed-default</code>	TRUE	<i>Deprecated:</i> See <a href="#">Section 5.4.2, “Setting Global Defaults for Resource Attributes”</a> instead
<code>default-action-timeout</code>	20s	<i>Deprecated:</i> See <a href="#">Section 5.5.3, “Setting Global Defaults for Operations”</a> instead
